

Define a custom path for the Netop log file

Article Number: 522 | Last Updated: Tue, Jul 7, 2020 1:32 PM

Define a custom path for the Netop log file Starting with version 12.83 of the Netop **Host** you can manually define a custom path for the Netop log file and is now enforced with a *.log extension. When you define a custom path, the option to modify the log file name from the **Log Setup > Netop Local** tab from the user interface becomes unavailable. To define a custom path for the Netop log file, proceed as follows: Open the netop.ini file with a text editor (i.e., Notepad). The default location for the netop.ini file is C:\Windows. Add the following string: CustomLocalLogFile=.

For example, CustomLocalLogFile=C:\LocalLogs\Netop.

NOTE: The log file extension is automatically added to the log file name.

Save the file. **NOTE:** This applies only to Netop **Host** version 12.83 or higher. When you upgrade to the latest version of the Netop **Host** if you have a predefined custom log path it is maintained. The path is added in the netop.ini file and is enforced in the Netop **Host** user interface.
