How to automate predefined jobs e.g. file transfer with ad hoc selected remote Host

Article Number: 539 | Last Updated: Thu, Jun 10, 2021 10:18 AM

If you are using Netop Remote Control to remotely connect to endpoints and want to automate a predefined file trans
job, you can do this by using the Guest scripting feature. A standard Guest script provides this feature for a predefine
set of endpoints. But you can add more flexibility to the standard script and be able to create ad hoc connections to
various endpoint Hosts and perform a predefined file transfer job. In this example a file transfer operation is describe
but it might as well be another type of session e.g. run a program or script on the remote Host computer. The attache
package consists of three files. Â All to be used on the Windows Guest computer: Adhocft.template - holds the
information used for the final temporary ad hoc script adhocft.dws; Getfile.cmd Â - the script to be launched to initializ
the session; Sed-4.2.1-setup.exe â€" script application to be installed on the Guest computer â€" needed for the
processing; Here is what to do: Extract the zip file to a suitable folder of your choice on the Guest computer; Edit th
adhocft.template to match your file transfer requirements.

The predefined parameters in this template are the communication profile to use (in this case TCP/IP), the copy-from
path file on the Host and copy-to path on the Guest. The login credentials for the Host connection can be defined too
this has to be done from within the Guest in order to have the password encrypted. The adhocft.template also holds
information related to reactions to events; Run the sed setup executable to install it; Launch the getfile command scr
It prompts you for Host ID - type IP address or DNS name. It then injects this into a temporary Guest script
(adhocft.dws), which launches the Guest; The Guest should connect to the Host, prompt you for credentials (if not
predefined) and then perform the file transfer; Â The script will prompt the user for a Host IP address and then inject
into a new dws file which is used to launch the Guest and process the file transfer. Â   **Disclaimer:** The sample scri
and tools provided here are not supported under any Netop standard support program or service. All scripts are prov
as is without warranty of any kind. Any risk arising by the use or performance of the sample scripts, tools and
documentation remains with you. In no event shall Netop, its authors, or anyone else involved in the creation, produc
or delivery of the scripts and tools be liable for any damages whatsoever.   Â
